

A launch curve. Tested before launch.

Compare graduation targets against the same demand. Keep the experiment that explains the tradeoff.

Verified mainnet histories

Meteora SDK math

Portable presets

Same orders. Very different migration timing.

SCENARIO	TARGET, SOL	GRADUATES AT BUY	DBC FEE VALUE, SOL
Graduate sooner	5.48	1	0.01096
Original config	10.96	45	0.02192
Graduate later	21.92	199	0.04384

Buy orders stay fixed; sells are omitted. Alternatives use standard allocation defaults. Fee values combine partner and creator shares and are not SOL cash payouts.

See the path to graduation.

Actual interface capture. Each line stops when its curve graduates; the comparison also accounts for unfilled and later demand.

The stored swaps replay exactly.

493 / 493

Recorded swaps matched.

Integer checks cover output amount, next price, and quote reserve.

3 verified histories

One fits the current designer. The other two remain available to offline verification.

Buys and sells, checked

The original launch migrates at swap 491. The buys-only baseline migrates at buy 45.

Incomplete data is quarantined

Reserve continuity and replay checks run before a fixture enters the corpus.

Keep the inputs. Reproduce the result.

01 / LOAD

Start with a question

Explore graduation timing, curve length, or fee sensitivity with a complete saved comparison.

02 / FORK

Change one assumption

Make an independent copy, change a control, and record the intended use and your reasoning.

03 / SHARE

Export the experiment

Import validated JSON in another browser. Mainnet examples need the same verified fixture.

Working today: browser storage, search, import, export, and source attribution. Files contain simulation inputs. A shared or paid marketplace is future work.

Try a verified launch. Fork one assumption.

For launchpad builders evaluating the DBC phase of a new asset launch.

```
npm ci
npm run dev
npm run demo:evidence
```

Current scope excludes post-migration trading, dynamic fees, wallet execution, and trader-behavior prediction. The prototype and this deck are prepared locally for release review.

Next: five builder pilots

Gather feedback on configuration choices and reproducibility.
No external usage or revenue is claimed yet.

Then: shared configuration work

Broader histories and team libraries. Tokenized-equity applications remain an unvalidated use case.
